Description of Procedure or Service

Description

Botulinum is a family of toxins produced by the anaerobic organism Clostridia botulinum. Four formulations of botulinum toxin have been approved by the U.S. Food and Drug Administration (FDA). Labeled indications of these agents differ; however, all are FDA-approved for treating cervical dystonia in adults. Botulinum toxin products are also used for a range of off-label indications.

Background

There are 7 distinct serotypes designated as type A, B, C-1, D, E, F, and G. In the U.S., 4 preparations of botulinum are commercially available, 3 using type A serotype and 1 using type B. The drug names of the botulinum toxin products were changed in 2009; trade names and product formulations did not change. The 3 formulations of botulinum toxin type A are currently called onabotulinumtoxinA (Botox®, abobotulinumtoxinA (Dysport®), and incobotulinumtoxinA (Xeomin®). Botox has been available for the longest time in the United States and has been the most widely used. Xeomin, the newest product marketed in the U.S., consists of the pure neurotoxin without complexing proteins and is the only product that is stable at room temperature for up to 4 years. Myobloc® contains botulinum toxin type B; the current name of this drug is rimabotulinumtoxinB.

All 4 products are approved by the U.S. Food and Drug Administration (FDA) for the treatment of cervical dystonia in adults; this is the only FDA-approved indication for Myobloc. Dystonia is a general term describing a state of abnormal or disordered tonicity of muscle. As an example, esophageal achalasia is a dystonia of the lower esophageal sphincter, while cervical dystonia is also known as torticollis. Spasticity is a subset of dystonia, describing a velocity-dependent increase in tonic-stretch reflexes with exaggerated tendon jerks. Spasticity typically is associated with injuries to the central nervous system. Spasticity is a common feature of cerebral palsy. Botox is approved for treating spasticity in adults. Botox is also approved for treating blepharospasm associated with dystonia and treating strabismus in patients ≥ 12 years of age. On October 15, 2010, FDA approved Botox injection for prevention of chronic migraine. Chronic migraine is defined as episodes that otherwise meet criteria for migraine (eg, at least 4 hours in duration) that occur on at least 15 days per month for more than 3 months, in the absence of medication overuse. OnabotulinumtoxinA is also approved for treatment of urinary incontinence due to neurogenic conditions causing detrusor overactivity in patients unresponsive to or intolerant to anticholinergic medication. Most recently, in 2013, onabotulinumtoxinA received FDA approval for treatment of overactive bladder (OAB) in adults who are unresponsive to or intolerant to at least one anticholinergic medication.

The newest product, Xeomin, is approved for treating upper limb spasticity in adult patients and blepharospasm in patients previously treated with onabotulinumtoxinA.
Botulinum Toxin Injection

Three products, Botox (marketed as Botox Cosmetic), Dysport, and Xeomin are approved for temporarily improving the appearance of glabellar (frown) lines in adults.

The botulinum toxin products have also been used for a wide variety of off-label indications.

**Regulatory Status**

Botox® (Allergan, Irvine, CA) was approved by the FDA in 1991, Myobloc® (Solstice Neurosciences) in 2000, Dysport® (Medicis Pharmaceutical Corporation, Scottsdale, AZ) in 2009, and Xeomin® (Merz Pharmaceuticals) in 2010.

**Related Policies**

Hyperhidrosis, Treatment of

***Please note that the US Food & Drug Administration (FDA) now requires a boxed warning and a Risk Evaluation and Mitigation Strategy (REMS) for all Botulinum Toxin products. Refer to the FDA Website for additional information located at http://www.fda.gov/Drugs/DrugSafety/PostmarketDrugSafetyInformationforPatientsandProviders/DrugSafetyInformationforHealthcareProfessionals/ucm174949.htm.

***Note: This Medical Policy is complex and technical. For questions concerning the technical language and/or specific clinical indications for its use, please consult your physician.

**Policy**

BCBSNC will provide coverage for Botulinum Toxin Injection when it is determined to be medically necessary because the medical criteria and guidelines shown below are met.

**Benefits Application**

This medical policy relates only to the services or supplies described herein. Please refer to the Member's Benefit Booklet for availability of benefits. Member's benefits may vary according to benefit design; therefore member benefit language should be reviewed before applying the terms of this medical policy.

**When Botulinum Toxin Injection is covered**

The use of botulinum toxin may be considered medically necessary for the following:

1. Cervical dystonia (spasmodic torticollis; applicable whether congenital, due to child birth injury, or traumatic injury). For this use, cervical dystonia must be associated with sustained head tilt or abnormal posturing with limited range of motion in the neck AND a history of recurrent involuntary contraction of one or more of the muscles of the neck, e.g., sternocleidomastoid, splenius, trapezius, or posterior cervical muscles*. (See additional details in Policy Guidelines section.)
2. Strabismus*
3. Blepharospasm or facial nerve (VII) disorders (including hemifacial spasm)*
4. Upper limb spasticity*
5. Prevention (treatment) of chronic migraine headache in the following situations*: (See Policy Guidelines)
   a. Initial 6-month trial: Adult patients who meet International Classification of Headache Disorders (ICHD) diagnostic criteria for chronic migraine headache and have symptoms
Botulinum Toxin Injection

that persist despite adequate trials of at least 2 agents used to prevent migraines or reduce migraine frequency representing different classes of medications. (Patients who have contraindications to preventive medications are not required to undergo a trial of these agents).

b. Continuation of treatment beyond 6 months:
   • Migraine headache frequency reduced by at least 7 days per month compared to pre-treatment level, or
   • Migraine headache duration reduced at least 100 hours per month compared to pre-treatment level.

6. Dystonia/spasticity resulting in functional impairment (interference with joint function, mobility, communication, nutritional intake) with or without pain. Examples include but are not limited to patients with any of the following:
   a. Focal dystonias:
      • Focal upper limb dystonia (e.g., organic writer’s cramp)
      • Oromandibular dystonia (orofacial dyskinesia, Meige syndrome)
      • Laryngeal dystonia (adductor spasmodic dysphonia)
      • Idiopathic (primary or genetic) torsion dystonia
      • Symptomatic (acquired) torsion dystonia
   b. Spastic conditions
      • Cerebral palsy
      • Spasticity related to stroke
      • Acquired spinal cord or brain injury
      • Hereditary spastic paraparesis
      • Spastic hemiplegia
      • Neuromyelitis optica
      • Multiple sclerosis or Schilder’s disease

7. Esophageal achalasia in patients who have not responded to dilation therapy or who are considered poor surgical candidates
8. Sialorrhea (drooling) associated with Parkinson disease
9. Chronic anal fissure
10. Urinary incontinence due to detrusor overactivity* associated with neurogenic causes (e.g., spinal cord injury, multiple sclerosis), that is inadequately controlled with anticholinergics
11. Overactive bladder* (OAB) with symptoms of urge urinary incontinence, urgency, and frequency, in adults who have an inadequate response to or are intolerant of an anticholinergic medication

For continuation of therapy for any diagnosis, the following criteria must be met:
1. Documentation of positive clinical response to botulinum toxin therapy, and
2. Statement of expected frequency and duration of proposed botulinum toxin treatment, and
3. Botulinum toxin administration is no more frequent than every 12 weeks, regardless of diagnosis.

*FDA-approved indication for at least one of the agents.

***Use of botulinum toxin for off-label indications should only be done when the treating physician has determined that the benefits of the treatment clearly outweigh the risks of the therapy.

When Botulinum Toxin Injection is not covered

With the exception of cosmetic indications, the use of botulinum toxin is considered investigational for all other indications not specifically mentioned above, including, but not limited to
Botulinum Toxin Injection

- headaches, except as noted above for prevention (treatment) of chronic migraine headache
- chronic low back pain
- joint pain
- mechanical neck disorders
- neuropathic pain after neck dissection
- myofascial pain syndrome
- temporomandibular joint disorders
- trigeminal neuralgia
- pain after hemorrhoidectomy or lumpectomy
- tremors such as benign essential tremor (upper extremity)
- tinnitus
- sialorrhea (drooling) except that associated with Parkinson disease
- chronic motor tic disorder, and tics associated with Tourette syndrome (motor tics)
- lateral epicondylitis
- benign prostatic hyperplasia
- interstitial cystitis
- detrusor sphincteric dyssynergia (after spinal cord injury)
- piriformis
- prevention of pain associated with breast reconstruction after mastectomy
- Hirschsprung’s disease
- gastroparesis
- facial wound healing
- internal anal sphincter (IAS) achalasia
- depression

The use of botulinum toxin is not medically necessary as a treatment of wrinkles or other cosmetic indications.

The use of assays to detect antibodies to botulinum toxin is considered investigational.

Policy Guidelines

This drug may require prior review. In cases for which botulinum toxin has been approved in the past, medical records may be required yearly to document ongoing effectiveness. For the indication of prevention of chronic migraine headaches, medical records may be required to document effectiveness after the initial 6-month trial and yearly thereafter.

International Classification of Headache Disorders (ICHD-3) diagnostic criteria for chronic migraine headache include the following:

Headaches at least 15 days per month for more than 3 months; have features of migraine headache on at least 8 days.

Features of migraine headache:

- Lasts 4 to 72 hours;
- Has at least 2 of the following 4 characteristics:
  o Unilateral
  o Pulsating
  o Moderate or severe pain intensity
  o Aggravates or causes avoidance of routine physical activity
Botulinum Toxin Injection

• Associated with:
  o Nausea and/or vomiting
  o Photophobia and phonophobia

(In ICHD-2, absence of medication overuse was one of the diagnostic criteria for chronic migraine. In the ICHD-3, this criterion was removed from the chronic migraine diagnosis and “medication overuse headache” is now a separate diagnostic category.)

Continuing treatment with botulinum toxin beyond 6 months for chronic migraine includes the following:

The policy includes the requirement that migraine headache frequency be reduced by at least 7 days per month compared with pretreatment level, or that migraine headache duration be reduced by at least 100 hours per month compared with pretreatment level in order to continue treatment beyond 6 months. The 7 days per month represents a 50% reduction in migraine days for patients who have the lowest possible number of migraine days (15) that would allow them to meet the ICHD-3 diagnostic criteria fewest chronic migraine. A 50% reduction in frequency is a common outcome measure for assessing the efficacy of headache treatments and was one of the end points of the PREEMPT study.

Cervical dystonia is a movement disorder (nervous system disease) characterized by sustained muscle contractions. This results in involuntary, abnormal, squeezing and twisting muscle contractions in the head and neck region. These muscle contractions result in sustained abnormal positions or posturing. Sideways or lateral rotation of the head and twisting of the neck is the most common finding in cervical dystonia. Muscle hypertrophy occurs in most patients. When using botulinum toxin to treat cervical dystonia, the postural disturbance and pain must be of a severity to interfere with activities of daily living; and the symptoms must have been unresponsive to a trial of standard conservative therapy. In addition, before using botulinum toxin, alternative causes of symptoms such as cervicogenic headaches must have been considered and excluded. Clinical improvement generally begins within the first two weeks after injection with maximum clinical benefit at approximately six weeks post-injection. Most patients have returned to pre-treatment status by 3 months post-treatment.

Billing/Coding/Physician Documentation Information

This policy may apply to the following codes. Inclusion of a code in this section does not guarantee that it will be reimbursed. For further information on reimbursement guidelines, please see Administrative Policies on the Blue Cross Blue Shield of North Carolina web site at www.bcbsnc.com. They are listed in the Category Search on the Medical Policy search page.

Applicable codes: 46505, 52287, 64611, 64612, 64615, 64616, 64617, 64642, 64643, 64644, 64645, 64646, 64647, 64653, 67345, 95873, 95874, J0585, J0586, J0587, J0588, S2340, S2341

BCBSNC may request medical records for determination of medical necessity. When medical records are requested, letters of support and/or explanation are often useful, but are not sufficient documentation unless all specific information needed to make a medical necessity determination is included.

Botulinum Toxin Injection

4/96 Revised: Added additional covered indications and investigational indications, TEC Bulletin 2/96

4/97 Reaffirmed

5/99 Reaffirmed

7/99 Reformatted, Description of Procedure or Service changed, Medical Term Definitions added.

4/2000 Statement added to section, "When Botulinum-A Toxin Injection is not covered", which says, "1) For conditions other than those listed above." System coding changes.

7/00 Added Gustatory sweating (Frey’s Syndrome) as a covered indication. Specialty Matched Consultant Advisory Panel.

9/00 Medical Policy Advisory Group review. Approved. No change in criteria.

10/00 Revised. Criteria changes. Botulinum now eligible for coverage for achalasia, chronic anal fissure, and investigational for headache or migraine, myofascial pain syndrome, or tremors such as benign essential tremor, chronic motor tic disorder and tics associated with Tourette syndrome. Medical Policy Advisory Group - Approved.

04/01 Changes in formatting.

10/01 Policy name changed from Botulinum A Toxin Injection. Revised description to include type B Botulinum (Myobloc) and FDA labeled indications to include cervical dystonia. System application guidelines revised.

3/02 System coding changes. Added code J0587 to policy and removed code J3490.

5/02 Revised under when it is covered, number 3. a. to include, "and/or". Codes 64612-64614, and 67345 added to Billing and Coding section.

8/03 Description section revised for clarity. Added spasmodic dysphonia under "When Covered" section. Added chronic low back pain under "When Not Covered" section. Reformatted "When Covered" and "When Not Covered" sections for ease of reading. Removed codes 64040 and 67399 from Billing and Coding section. Added Codes S2340 and S2341 to Billing and Coding section. Added references.

2/17/05 Added the following statement to "When Covered" and "Policy Guidelines" sections: Refer to separate policy number MED1215, titled "Hyperhidrosis, Treatment of" regarding Botulinum toxin injection guidelines for patients with primary Hyperhidrosis. Key word added.

1/19/06 Added 2006 CPT codes 46505, 64653, 95873, 95874 to Billing/Coding section.
Botulinum Toxin Injection

9/18/06 Under "When Covered" section, added "Botulinum toxin may be considered medically necessary as a treatment of incontinence due to detrusor overreactivity caused by spinal cord injury that is inadequately controlled with anticholinergic therapy." Under "When not Covered" section, 3.c. now reads "headache including migraine, chronic tension, chronic daily, and cervicodystonic headaches". Added 3.i. sialorrhea (drooling); 3.j. lateral epicondylitis; 3.k. benign prostatic hyperplasia; 3.l. detrusor overactivity not due to spinal cord injury; 3.m. detrusor sphincteric dyssynergia. Medical term definitions added. Reference sources added.

8/27/07 Under "When Covered" section: 1.c.- added "such as hemifacial spasm"; 1.d.- added "(see "Policy Guidelines" section for use of Botulinum Toxin for this indication)"; 2.i.- added "or to demyelinating conditions such as multiple sclerosis."; deleted 2.k. Spasmodic torticollis; 3.b.- revised to "lower esophageal achalasia where the patient has not responded to dilation therapy or where the patient is considered a poor surgical candidate." Under "When not Covered" section: 3.a.- end of sentence revised to "and cervicogenic or "cervicodystonic"; added 3.l. priformis syndrome. Under "Policy Guidelines" section: Added A.1-5: Use of Botulinum Toxin for Cervical Dystonia (Spasmodic Torticollis): ALL of the following criteria must be met: 1) Postural disturbance and pain must be of moderate or greater severity as documented by interference with specific activities of daily living and unresponsive to a trial of appropriate standard conservative therapy that may include non-narcotic analgesics, muscle relaxants and physical modalities; AND 2) There are clonic and/or tonic involuntary contractions of multiple neck muscles (that is, sternocleidomastoid, splenius, trapezius and/or posterior cervical muscles); AND 3) There is sustained head torsion and/or tilt with limited range of motion in the neck; AND 4) The duration of the condition must be greater than six months; AND 5) Alternative causes of the patient's symptoms have been considered and ruled out including chronic neuroleptic treatment, cervicogenic headaches, myofascial pain syndrome, contractures or other neuromuscular conditions. Added B. Contraindications for use of Botulinum toxin: 1)Absolute: a. Inflammation or infection at the site of injection. b. Allergy to the drug. 2) Relative: a. Inability of patient to cooperate b. Coagulopathy c. Disease of neuromuscular transmission: i. Myasthenia Gravis ii. Eaton Lambert Syndrome iii. Amyotrophic lateral sclerosis iv. Peripheral neuropathy v. Motor neuron disease d. Concurrent use of medications that affect neuromuscular transmission such as aminoglycoside antibiotics. Medical Term Definitions added. Notification given 8/27/07. Effective date 11/5/07.

4/7/08 Added FDA warning information to the "Description" section; "Please note that the US Food & Drug Administration (FDA) has issued a warning regarding the use of botulinum toxin. It has been reported that there have been serious systemic adverse reactions including respiratory distress and death from botulinum toxins types A and B. The adverse events have occurred in both FDA approved and unapproved uses. Most of the adverse events have occurred in children treated for cerebral palsy associated limb spasticity. Safety, efficacy and dosage have not be established of the use of Botulinum toxins for limb spasticity of cerebral palsy or any condition in children under the age of 12. Also added the following to the "When Covered" section; "The treating physician should carefully review the above FDA issued warning. Use of botulinum toxin for off-label indications should only be done when the treating physician has determined that the benefits of the treatment clearly outweigh the risks of the therapy." References added.

7/14/08 Specialty Matched Consultant Advisory review 5/29/08. Added comment; "(See "Policy Guidelines" section for use of Botulinum Toxin for this indication)" to 3.a. under the "When Covered" section. Changed the wording in #5 under the "When Covered" section to read
An Independent Licensee of the Blue Cross and Blue Shield Association

Botulinum Toxin Injection

"either idiopathic or due to neurogenic causes" and added "multiple sclerosis" as an example. Added additional examples of non-covered indications under the "When Covered" section. These are "c. joint pain, d. mechanical neck disorders, e. neuropathic pain after neck dissection, g. pain after hemorrhoidectomy or lumpectomy, and n. interstitial cystitis." No change to policy intent. Added "Myoclonus and Tics" to "Definition" section. References added.

1/12/09 Revised "Description" section to add; "Type A (Botox®) is more potent and longer acting than type B (Myobloc®). Units and dosing are not equivalent and cannot be interchanged." The word "warning" was removed from the statement; "(FDA) has issued an early communication regarding an on-going safety review" and added "The FDA plans to communicate to the public its findings, resulting recommendations, and any regulatory actions after the review of the data are completed." Updated the "When Covered" section with the following changes;"2. dystonia/spasticity resulting in functional impairment (interference with joint function, mobility, communication, nutritional intake)" and statement "The treating physician should carefully review the above FDA issued warning." Added additional wording for clarifications to various indications and an additional indication; "2.k. Spinal cord or traumatic brain injury." Added additional wording for clarification to various indications in the "When Not Covered" section and "4. The use of assays to detect antibodies to botulinum toxin is considered investigational." Added "In cases for which botox has been approved in the past, medical records are required yearly to document ongoing effectiveness of botox" to the "Policy Guidelines section. References added.

10/26/09 Revised "Description" section. Added information related to the FDA approval of Dysport for cervical dystonia, new established names of Botox and Myobloc, and the FDA requirement of a boxed warning and a Risk Evaluation and Mitigation Strategy (REMS) for all Botulinum Toxin products. Changed "paraplegia" to paraparesis under the "When Covered" section. Added 3.d. "Sialorrhea (drooling) associated with Parkinson disease" to the "When covered" section. Changed the wording under the "Policy Guidelines" section in A.2. from "involuntary contractions of multiple neck muscles" to "involuntary contractions of one or more neck muscles". Reviewed with the Senior Medical Director 9/16/09. References added. (btw)

1/5/10 Added new HCPCS code, J0586, to "Billing/Coding" section. (btw)

6/22/10 Policy Number(s) removed. (amw)

2/1/11 Updated “Description” section to include information regarding FDA approval of onabotulinumtoxinA (Botox) for the prevention of chronic headache. Added #5 to the “When Covered” section to indicate; “5. Prevention (treatment) of chronic migraine headache in the following situations*: (see Policy Guidelines) a. Initial 6-month trial: Adult patients who meet established diagnostic criteria for chronic migraine headache and have symptoms that persist despite trials of at least 2 agents used to prevent migraines or reduce migraine frequency representing different classes of medications. (Patients who have contraindications to preventive medications are not required to undergo a trial of these agents). b. Continuing treatment beyond 6 months: Migraine headache frequency reduced by at least 7 days per month, or Migraine headache duration reduced at least 100 hours per month.” Added the
Botulinum Toxin Injection

International Headache Classification definition of migraine to “Policy Guidelines” section. References added. Reviewed by Medical Director 1/25/2011. (btw)

3/29/11 Added new HCPCS code, Q2040” to “Billing/Coding” section. Removed deleted code, C9278. (btw)

12/20/11 Specialty Matched Consultant Advisory Panel review 11/30/2011. Added the following indications to the “When Not Covered” section for clarification: prevention of pain associated with breast reconstruction after mastectomy, Hirschsprung’s disease, and gastroparesis. Changed wording in number 6 to “Examples include but are not limited to patients with any of the following:”. No change to policy intent. Added 2012 HCPCS code, J0588, to “Billing/Coding” section and deleted Q2040 and C9278. References added. (btw)

11/13/12 Specialty Matched Consultant Advisory Panel review 10/17/2012. No change to policy intent. The definition of “chronic migraine” was updated in the Policy Guidelines to include “with greater than or equal to 8 meeting criteria for migraines; provided there is no medication overuse.” Reference added. (btw)

12/28/12 Effective 1/1/2013, new CPT codes, 52287 and 64615, added to Billing/Coding section. (btw)

2/26/13 Added “urgency, and frequency” and the “*” indicating FDA approval to number 10 under the When Covered section. Medical Director review 2/2/2013. (btw)

5/28/13 Removed “urgency and frequency” from #10 under the When Covered section. Added #11. “Overactive bladder (OAB) with symptoms of urge urinary incontinence, urgency, and frequency, in adults who have an inadequate response to or are intolerant of an anticholinergic medication”. Reference added. Senior Medical Director review 5/18/2013. (btw)

12/31/13 Specialty Matched Consultant Advisory Panel review 10/16/2013. Description section updated. Changed the wording in #6 under the When Covered section from “and/or” to “with or without” for clarification. Added Facial wound healing and internal anal sphincter (IAS) achalasia to the When Not Covered section. Added new 2014 CPT codes, 64616, 64617, 64642, 64643, 64644, 64645, 64646, and 64647 to Billing/Coding section. Removed deleted codes, 64613 and 64614. Reference added. (btw)

1/26/16 Reference added. FDA approval given for Xeomin® to treat upper limb spasticity in adult patients. (sk)
