Chelation Therapy

Chelation therapy, an established treatment for treating heavy metal toxicities, has been investigated for a variety of off-label applications including treatment of atherosclerosis, Alzheimer’s disease, and autism.

Chelation therapy is an established treatment for the removal of metal toxins by converting them to a chemically inert form that can be excreted in the urine. Chelation therapy consists of the intravenous or oral administration of chelating agents that remove metal ions such as lead, aluminum, mercury, arsenic, zinc, iron, copper, and calcium from the body.

Specific chelating agents are used for particular heavy metal toxicities. For example, desferroxamine (not Food and Drug Administration [FDA] approved) is used for patients with iron toxicity, and calcium-ethylenediaminetetraacetic acid (-EDTA) is used for patients with lead poisoning. Note that disodium-EDTA is not recommended for acute lead poisoning due to the increased risk of death from hypocalcemia. Another class of chelating agents, called metal protein attenuating compounds (MPACs), is under investigation for the treatment of Alzheimer’s disease, which is associated with the disequilibrium of cerebral metals. Unlike traditional systemic chelators that bind and remove metals from tissues systemically, MPACs have subtle effects on metal homeostasis and abnormal metal interactions. In animal models of Alzheimer’s disease, they promote the solubilization and clearance of Aβ-amyloid protein by binding its metal-ion complex and also inhibit redox reactions that generate neurotoxic free radicals. MPACs therefore interrupt two putative pathogenic processes of Alzheimer’s disease. However, no MPACs have received U.S. Food and Drug Administration (FDA) approval for the treatment of Alzheimer’s disease. Chelation therapy has also been discussed as a treatment for other indications including atherosclerosis, Alzheimer’s disease, and autism. For example, EDTA chelation therapy has been proposed in patients with atherosclerosis as a method of decreasing obstruction in the arteries.

Regulatory Status

Calcium-EDTA (Versenate) was approved by the FDA for lowering blood lead levels among both pediatric and adult patients with lead poisoning. Succimer is approved for the treatment of lead poisoning in pediatric patients only. Disodium-EDTA was approved by the FDA for use in selected patients with hypercalcemia and for use in patients with heart rhythm problems due to intoxication with the drug, digitalis. In 2008, the FDA withdrew approval of disodium-EDTA due to safety concerns and recommended that other forms of chelation therapy be used.

Several iron chelating agents have received FDA approval. Deferoxamine for subcutaneous, intramuscular, or intravenous injections was approved for treating acute iron intoxication and chronic iron overload due to transfusion-dependent anemia. Deferasirox, approved in 2005, is available as a tablet for oral suspension and is indicated for the treatment of chronic iron overload due to blood transfusions in patients aged 2 years and older. Under the accelerated approval program, the FDA expanded approval of deferasirox in 2013 to include the treatment of patients age 10 and older with chronic iron overload due to nontransfusion-dependent thalassemia (NDTD). In 2011, the FDA approved...
Chelation Therapy

the iron chelator deferiprone (Ferriprox®) for the treatment of patients with transfusional overload due to thalassemia syndromes when other chelation therapy is inadequate. Deferiprone is available in tablet form for oral use.

In a June 2014 warning to consumers, FDA advised that FDA-approved chelating agents are available by prescription only. There are no FDA-approved over-the-counter chelation products.

***Note: This Medical Policy is complex and technical. For questions concerning the technical language and/or specific clinical indications for its use, please consult your physician.

Policy

BCBSNC will provide coverage for Chelation Therapy when it is determined to be medically necessary because the medical criteria and guidelines shown below are met.

Benefits Application

This medical policy relates only to the services or supplies described herein. Please refer to the Member's Benefit Booklet for availability of benefits. Member's benefits may vary according to benefit design; therefore member benefit language should be reviewed before applying the terms of this medical policy.

When Chelation Therapy is covered

Parenteral chelation therapy may be considered medically necessary for the treatment of documented systemic iron overload (hemochromatosis), lead poisoning, or other heavy metal toxicity as defined below:

- **Hemochromatosis**: Clinical symptoms of chronic iron toxicity should correlate with an elevated serum ferritin. Parenteral chelation therapy is not medically necessary in genetic or hereditary hemochromatosis. Subcutaneous infusion of desferoxamine via a portable pump may be considered medically necessary for acquired hemochromatosis complicating a chronic hemolytic anemia such as thalassemia or sideroblastic anemia or when hypoproteinemia precludes phlebotomy as treatment.

- **Acute iron poisoning**: Parenteral deferoxamine is medically necessary in patients with serum iron level greater than 50umol/L (300ug/dL) or in whom a deferoxamine challenge test is positive.

- **Lead**: parenteral chelation therapy may meet medical necessity requirements in adults with blood lead levels greater than 1.7umol/L (35ug/dL) or in children with levels greater than 25 ug/dL. Parenteral EDTA and/or dimercaprol may be allowed until blood lead levels decrease (usually one to two 5-day courses of therapy).

- **Other heavy metals**: arsenic, cadmium, gold, mercury, and thallium poisoning are generally suspected based upon a positive urine screen for heavy metals in a symptomatic individual. Toxic levels should be confirmed with blood levels where appropriate.

- Parenteral chelation agents are not always appropriate and should be reviewed for approved indications against the specific heavy metal identified.

- Parenteral chelation therapy may also be medically necessary for the following indications:
  - Control of ventricular arrhythmias or heart block associated with digitalis toxicity
Chelation Therapy

- Emergency treatment of hypercalcemia
- Extreme conditions of metal toxicity
- Treatment of chronic iron overload due to blood transfusions (transfusional hemosiderosis) and due to nontransfusion-dependent thalassemia (NTDT)
- Wilson’s Disease (Hepatolenticular degeneration)
- Lead poisoning

When Chelation Therapy is not covered

Chelation therapy is considered investigational, including, but not limited to, the following conditions:

- Heavy metal toxicity or iron or lead poisoning where toxic levels are not documented by standard testing methods
- Atherosclerosis (e.g., coronary artery disease, peripheral vascular disease, secondary prevention in patients with myocardial infarction)
- Multiple sclerosis
- Arthritis (includes rheumatoid arthritis)
- Diabetes
- Autism
- Alzheimer’s disease
- Other indications not listed under “when chelation therapy is covered”

Policy Guidelines

Chelation therapy is an established treatment for the medically necessary indications listed in the policy statement. There is insufficient evidence that chelation therapy improves health outcomes for patients with conditions that are off-label for FDA approved chelating agents, including, but not limited to, atherosclerosis, autism, Alzheimer’s disease, diabetes and arthritis. One RCT, the TACT study, reported that chelation therapy reduced cardiovascular events in patients with a previous MI, and that the benefit was greater in diabetic patients compared to non-diabetic patients. However, this study had significant limitations, including high dropout rates, and therefore the conclusions are not definitive. Thus, chelation therapy for these off-label applications is considered investigational.

Digitalis toxicity is currently treated in most patients with Fab monoclonal antibodies. The FDA removed the approval for NaEDTA as chelation therapy due to safety concerns, and recommended that other chelators be used. This was the most common chelation agent used to treat digitalis toxicity and hypercalcemia.

Billing/Coding/Physician Documentation Information

An Independent Licensee of the Blue Cross and Blue Shield Association
Chelation Therapy

This policy may apply to the following codes. Inclusion of a code in this section does not guarantee that it will be reimbursed. For further information on reimbursement guidelines, please see Administrative Policies on the Blue Cross Blue Shield of North Carolina web site at www.bcbsnc.com. They are listed in the Category Search on the Medical Policy search page.

Applicable service codes: J0470, J0600, J3520, S9355, M0300

Documentation Requirements:
Laboratory results must be provided by a certified (CLIA) lab.

BCBSNC may request medical records for determination of medical necessity. When medical records are requested, letters of support and/or explanation are often useful, but are not sufficient documentation unless all specific information needed to make a medical necessity determination is included.

Policy Implementation/Update Information

12/97 Revised: Previous policy archived. See M0300.ARC. Additional information added to Policy for understanding of therapy.

8/99 Reformatted, Medical Term Definitions added.
10/99 Medical Policy Advisory Group - Added that statement that laboratory results must be provided by a certified lab

10/00 System coding changes.

4/02 Revised the description section and added, "Chelating agents may be given by mouth or by parenteral infusion". Revised bullet number 2 under when it is not covered to include, "by standard testing methods".

10/02 Specialty Matched Consultant Advisory Panel review. No change in policy.

6/22/10 Policy Number(s) removed (amw)

3/12/13 Specialty Matched Consultant Advisory panel review meeting 2/20/13. No change to policy statement. (lpr)

7/16/13 Under “When Covered” section: added extreme conditions of metal toxicity; treatment of chronic iron overload due to blood transfusions (transfusional hemosiderosis) and due to nontransfusion-dependent thalassemia (NDTD); lead poisoning. Under “ When Not Covered” section: added: “ secondary prevention in patients with myocardial infarction” as investigational indication to 2nd bullet Atherosclerosis. Updated Regulatory status. Reference updated. Notification date 7/16/13 for effective date 10/1/13. (lpr)

3/11/14 Specialty Matched Consultant Advisory Panel review meeting 2/25/2014. No change to policy statement. (lpr)

8/12/14 Updated description section, Regulatory status, and policy guidelines. Reference added. (lpr)

3/10/15 Minor updates to Description section. Specialty matched consultant advisory panel review meeting 2/25/2015. No change to policy statement. (lpr)

7/28/15 Under “When Not Covered” section, deleted “hypoglycemia” as this indication is not
Chelation Therapy

reviewed in this policy. Reference added. (lpr)

Medical policy is not an authorization, certification, explanation of benefits or a contract. Benefits and eligibility are determined before medical guidelines and payment guidelines are applied. Benefits are determined by the group contract and subscriber certificate that is in effect at the time services are rendered. This document is solely provided for informational purposes only and is based on research of current medical literature and review of common medical practices in the treatment and diagnosis of disease. Medical practices and knowledge are constantly changing and BCBSNC reserves the right to review and revise its medical policies periodically.
