Trastuzumab

Description of Procedure or Service

In certain cancers, the human epidermal growth factor receptor 2 (HER2) gene is amplified and overexpressed. Trastuzumab (Herceptin) is a humanized monoclonal antibody, HER2 protein receptor antagonist, which may be used for the treatment of certain cancers that overexpress HER2.

Approximately 20% to 25% of breast cancers overexpress HER2, a transmembrane glycoprotein receptor with tyrosine kinase activity. HER2, previously called HER2/neu, or ErbB-2,6 is part of the HER tyrosine kinase receptor family that includes 4 transmembrane receptors (HER1 [also known as epidermal growth factor receptor, HER2, HER3, HER4]). These receptors mediate tumor cell growth, survival, and differentiation. Human epidermal growth factor receptors, when activated by extracellular ligand binding, dimerize and activate cell-signaling through the phosphatidylinositol-3 (PI3)-kinase/AKT pathway, which regulates tumor cell survival, and the mitogen-activated protein kinase pathway, which regulates cellular proliferation. HER2 has no known ligand; it forms active heterodimers (particularly HER2:HER3) and, when overexpressed, homodimers (HER2:HER2) that constitutively activate tyrosine kinase signaling.

HER2 overexpression is associated with reduced time to disease recurrence and poorer prognosis. Before the advent of HER2-targeted therapy, HER2 overexpression was associated with shorter disease-free and overall survival than either lymph node–negative or lymph node–positive breast cancers; with lack of responsiveness to tamoxifen therapy; and with altered responsiveness to cytotoxic chemotherapy.

Treatment of HER2-Positive Breast Cancer

The Food and Drug Administration (FDA) has approved 4 anti-HER2 therapies. These agents arrest tumor cell growth and promote apoptosis by blocking HER2-mediated intracellular-signaling pathways that mediate cell growth, differentiation, and survival:

- Trastuzumab (Herceptin) is an intravenous monoclonal antibody to an extracellular domain of the HER2 receptor (subdomain IV) that prevents activation of intracellular tyrosine kinase signaling cascades and also promotes antibody-dependent cell-mediated cytotoxicity.
- Lapatinib (Tykerb®) is an oral tyrosine kinase inhibitor that blocks the intracellular tyrosine kinase domain of HER2 and downstream cell-signaling cascades.
- Pertuzumab (Perjeta™) is an intravenous monoclonal antibody to the extracellular dimerization domain of the HER2 receptor (subdomain II) that, like trastuzumab, prevents activation of intracellular tyrosine kinase signaling cascades and also promotes antibody-dependent cell-mediated cytotoxicity10
- Ado-trastuzumab emtansine (Kadcyla™) is an intravenous antibody-drug conjugate of trastuzumab and emtansine.
Trastuzumab

Trastuzumab is recommended as first-line treatment for patients with HER2-positive metastatic breast cancer, either in combination with pertuzumab and a taxane (preferred); in combination with a taxane (paclitaxel with or without carboplatin, or docetaxel), vinorelbine, or capecitabine; or as monotherapy. Treatment with trastuzumab plus an anthracycline (doxorubicin or daunorubicin) is not recommended because of unacceptably high rates of cardiac toxicity. Most patients who initially respond to trastuzumab will eventually progress.

For second-line treatment of HER2-positive metastatic breast cancer that progresses after trastuzumab therapy (either in the adjuvant setting or as first-line treatment for metastatic disease), a continuation of the HER2 blockade is recommended. For patients not previously exposed to pertuzumab, combination therapy with trastuzumab plus pertuzumab with or without cytotoxic chemotherapy (eg, a taxane or vinorelbine) is recommended. Other treatment options are trastuzumab plus lapatinib or capecitabine and lapatinib plus capecitabine. In patients who obtain sustained disease control, the optimal duration of HER2-targeted therapy is unknown.

Regulatory Status

Trastuzumab (Herceptin®) is a humanized monoclonal antibody against the extracellular domain of HER2. Trastuzumab has received FDA marketing approval for treatment of HER2-positive breast cancer in both the adjuvant and metastatic settings, and metastatic gastric or gastroesophageal junction adenocarcinoma. It first received FDA approval in September 1998 for use in metastatic breast cancer, as a first-line therapy in combination with paclitaxel and as a single agent in second- and third-line therapy.

The current FDA-approved labeling, as of September 2016, indicates trastuzumab is indicated as follows:

1. For adjuvant treatment of HER2 overexpressing node positive or node negative (ER/PR negative or with 1 high-risk feature) breast cancer:
   - as part of a treatment regimen consisting of doxorubicin, cyclophosphamide, and either paclitaxel or docetaxel;
   - as part of a treatment regimen of docetaxel and carboplatin; or
   - as a single agent following multi-modality anthracycline-based therapy. Trastuzumab is administered by IV [intravenous] infusion weekly or every 3 weeks for a total of 52 weeks depending on the dosing schedule and chemotherapy used for adjuvant treatment.

2. For treatment of HER2 overexpressing metastatic breast cancer in combination with for first-line treatment; or as a single agent in patients who have received one or more chemotherapy regimens for metastatic disease. Trastuzumab is administered by IV infusion weekly until disease progression.

3. For treatment of HER2 overexpressing metastatic gastric or gastroesophageal junction adenocarcinoma, in combination with cisplatin and capecitabine or 5-fluorouracil, in patients who have not received prior treatment for metastatic disease. Trastuzumab is administered by IV infusion every 3 weeks until disease progression.

Trastuzumab has received FDA marketing approval only for breast cancer in specific settings and for gastric or gastroesophageal junction adenocarcinoma. However, its activity has been investigated in the preoperative (neoadjuvant) setting for breast cancer, in combination with regimens besides those specified in the FDA-approved product label, and in a wide range of other types of cancer that overexpress HER2.

Trastuzumab carries a black box warning for cardiomyopathy, infusion reactions, and embryo-fetal toxicity. The prescribing labels state that patients should be evaluated for cardiac function before and during treatment as well as use effective contraception prior and during treatment.

Trastuzumab

***Note: This Medical Policy is complex and technical. For questions concerning the technical language and/or specific clinical indications for its use, please consult your physician.

Policy

BCBSNC will provide coverage for Trastuzumab when it is determined to be medically necessary because the medical criteria and guidelines shown below are met.

Benefits Application

This medical policy relates only to the services or supplies described herein. Please refer to the Member's Benefit Booklet for availability of benefits. Member's benefits may vary according to benefit design; therefore member benefit language should be reviewed before applying the terms of this medical policy.

When Trastuzumab is covered

**HER2-positive Breast Cancer**

Trastuzumab may be considered medically necessary for the treatment of patients with breast cancer whose tumors overexpress the HER2 protein (HER2-positive breast cancer.) This includes use as adjuvant therapy, neoadjuvant therapy, and treatment of metastatic disease.

**Conditions Other Than HER2-positive Breast Cancer**

Trastuzumab may be considered medically necessary, when used in combination with systemic chemotherapy, for treatment of patients with advanced (locally advanced or metastatic) gastric cancer or gastroesophageal junction adenocarcinoma whose tumors overexpress the HER2 protein (HER2-positive cancer).

Trastuzumab may be considered medically necessary for treatment of patients with esophageal adenocarcinoma (not squamous or upper esophageal cancer) with clearly positive HER2 overexpression, Category 1 when used with Cisplatin and 5FU or Capecitabine, and Category 2B with other combinations.

HER2-positive cancer is defined by patients who have tumors with HER2 protein overexpression as per at least one of the following:

1. Immunohistochemistry (IHC) 3+;
2. Fluorescent in situ hybridization (FISH) HER2 gene copy is greater than 6;
3. FISH ratio of HER2 gene/chromosome 17 ratio is greater than or equal to 2.0.

Use of Trastuzumab may be considered medically necessary for clinical indications not listed above when the drug is prescribed for the treatment of cancer either:

- In accordance with FDA label (when clinical benefit has been established, see Policy Guidelines); **OR**
- In accordance with specific strong endorsement or support by nationally recognized compendia, when such recommendation is based on strong/high levels of evidence, and/or uniform consensus of clinical appropriateness has been reached.

When Trastuzumab is not covered

Except as noted above, trastuzumab is considered investigational for the treatment of all other conditions including, but not limited to:

**HER2-negative breast cancer, and other cancers which may be HER2 positive;**
Trastuzumab

- Osteosarcoma;
- Non-small-cell lung, ovarian, prostate, head and neck, esophageal cancers (except as noted above);
- Gastric (except as noted above), pancreatic, colorectal, endometrial, or urothelial cancers.

Trastuzumab is considered investigational when used for:

1. Non-cancer indications; OR
2. When criteria are not met regarding FDA labeling OR strong endorsement/support by nationally recognized compendia, as stated under “When Trastuzumab is covered.”

Policy Guidelines

Targeted anti-HER2 therapy with trastuzumab has shown survival benefit for primary and metastatic breast cancer patients and has become the accepted and usual therapy for patients with HER2-positive breast cancer.

For individuals who have HER2 overexpressing breast cancer who receive trastuzumab as adjuvant, neoadjuvant, or treatment of metastatic disease, the evidence includes randomized controlled trials, single-arm trials and meta-analysis. Relevant outcomes are overall survival, disease-specific survival, morbid events, functional outcomes, health status measures, quality of life, and treatment-related mortality and morbidity. Trastuzumab has shown survival benefit for primary and metastatic breast cancer patients and has become the accepted and usual therapy for patients with HER2 positive breast cancer. The evidence is sufficient to determine that the technology results in a meaningful improvement in the net health outcome.

For individuals who have HER2 overexpressing metastatic gastric or gastroesophageal junction adenocarcinoma who receive trastuzumab plus cisplatin and capecitabine or 5-fluorouracil, the evidence includes randomized controlled trial and single arm trial. Relevant outcomes are overall survival, disease-specific survival, morbid events, functional outcomes, health status measures, quality of life, treatment-related mortality and treatment-related morbidity. Trastuzumab has shown survival benefit for HER2 overexpressing metastatic gastric or gastroesophageal junction adenocarcinoma in one phase 3 trial that reported a 2-month overall survival benefit in the trastuzumab arm and no difference in server adverse events between the group that received chemotherapy plus trastuzumab versus chemotherapy alone. The evidence is sufficient to determine that the technology results in a meaningful improvement in the net health outcome.

For individuals who have HER2-overexpressing malignancies (besides breast or gastric cancer) who are treated with trastuzumab plus standard of care, the evidence includes multiple single-arm and RCTs. Relevant outcomes are overall survival, disease-specific survival, morbid events, functional outcomes, health status measures, quality of life, treatment-related mortality and morbidity. The majority of these trials were conducted 10 to 15 years ago as pilots with small sample sizes in the early clinical development of trastuzumab. It should be noted that these trials ultimately reported negative or less than optimal efficacy results and they were terminated early due to limited accrual. The evidence is insufficient to determine the effects of technology on health outcomes.

Drugs prescribed for treatment of cancer in accordance with FDA label may be considered medically necessary when clinical benefit has been established, and should not be determined to be investigational as defined in Corporate Medical Policy (CMP), “Investigational (Experimental) Services.”

Please refer to CMP “Investigational (Experimental) Services” for a summary of evidence standards from nationally recognized compendia.
Trastuzumab

Billing/Coding/Physician Documentation Information

This policy may apply to the following codes. Inclusion of a code in this section does not guarantee that it will be reimbursed. For further information on reimbursement guidelines, please see Administrative Policies on the Blue Cross Blue Shield of North Carolina web site at www.bcbsnc.com. They are listed in the Category Search on the Medical Policy search page.

Applicable service codes: J9355, S0353, S0354

BCBSNC may request medical records for determination of medical necessity. When medical records are requested, letters of support and/or explanation are often useful, but are not sufficient documentation unless all specific information needed to make a medical necessity determination is included.

Policy Implementation/Update Information

Herceptin
Trastuzumab

2/99 Original policy developed. There appears to be little benefit in using Herceptin with 2+HER2 overexpressors. At the same time, the test for overexpression is somewhat subjective.

5/99 Reformatted, description of service changed, medical terms added.

9/99 Revised to include 2+ HER2 overexpression as per 1999 USPDI on-line update information.

1/00 Revised to add new HCPCS code J9355.

3/01 System changes.

6/01 Specialty Matched Consultant Advisory Panel review. No change in criteria.

4/04 Benefits Application and Billing/Coding sections updated for consistency.

9/18/06 Medical Policy changed to Evidence Based Guideline.

5/21/07 Specialty Matched Consultant Advisory Panel review 4/25/2007. Added additional indication under "Evidence Based Guideline for Herceptin" which states; "Herceptin® in combination with adjuvant chemotherapy may be appropriate for patients who have had completely resected HER-2-positive breast cancer and have either of the following: 1. Node-positive disease; or 2. High-risk breast cancer, defined as either tumors greater than 1 cm if the tumor is estrogen receptor negative OR if the tumor is greater than 2 cm and is estrogen receptor positive." References added.

5/18/09 The following statement was added to the guideline: "Herceptin as a component of preoperative (neoadjuvant or primary systemic) therapy, followed by additional postoperative adjuvant trastuzumab may be appropriate to complete a full year of treatment, for patients with HER2-positive breast cancer undergoing medically appropriate preoperative chemotherapy." Also added a statement to indicate Herceptin may not be appropriate for indications other than those listed in the guideline, including the treatment of other malignancies such as osteosarcoma, non-small-cell lung, ovarian, prostate, head and neck, esophageal, gastric, pancreatic, colorectal, endometrial, or urothelial cancers. Specialty Matched Consultant Advisory Panel review 4/21/09. (btw)

6/22/10 Policy Guideline Number(s) removed (amw)

9/14/10 “Description” section extensively revised. Reworded the “When Recommended” section to indicate; “Trastuzumab may be appropriate, when used in combination with systemic chemotherapy, for treatment of patients with advanced (locally advanced or metastatic) gastric cancer or gastroesophageal junction adenocarcinoma whose tumors overexpress the HER2 protein (HER2-positive cancer).” The “When Not Recommended” section reworded to remove reference to gastric cancer and gastroesophageal adenocarcinoma. Medical Director review 8/10/2010. References added. (btw)

6/21/11 Reference added. (btw)
Trastuzumab

5/12  Title changed from “Herceptin” to “Trastuzumab”. Specialty Matched Consultant Advisory Panel review 3/21/2012. Removed “esophageal and gastric” from the When Not Recommended section. No change to guideline intent. (btw)

6/29/12  Description section revised. No change to guideline intent. Policy Guidelines updated. Medical Director review 6/10/12. Reference added. (btw)

4/16/12  Specialty Matched Consultant Advisory Panel review 3/20/2013. Added “esophageal (except as noted above), gastric (except as noted above)” to the When Not Recommended statement. (btw)

5/13/14  Reference added. (btw)

11/24/15  Reference added. No change to policy statement. (lpr)

4/29/16  Specialty Matched Consultant Advisory Panel review 3/30/2016. No change to policy intent. (lpr)

12/30/16  Added definition of HER2 in the “When Covered” section. Added covered indication for esophageal adenocarcinoma: “Trastuzumab may be considered medically necessary for treatment of patients with esophageal adenocarcinoma (not squamous or upper esophageal cancer) with clearly positive HER2 overexpression, Category 1 when used with Cisplatin and 5FU or Capecitabine, and Category 2B with other combinations.” Added HCPCS codes S0353 and S0354 to Billing/Coding section. Updated Policy Guidelines section. Medical Director review 10/2016. Reference added. Notification given 12/30/16 for effective date 4/1/17. (lpr)

4/28/17  Added the following statement to “When Covered” section: “Use of Trastuzumab may be considered medically necessary for clinical indications not listed above when the drug is prescribed for the treatment of cancer either: In accordance with FDA label (when clinical benefit has been established, see Policy Guidelines); OR In accordance with specific strong endorsement or support by nationally recognized compendia, when such recommendation is based on strong/high levels of evidence, and/or uniform consensus of clinical appropriateness has been reached”. Under “When Not Covered” section, added the statement “Trastuzumab is considered investigational when used for: 1)Non-cancer indications; OR 2) When criteria are not met regarding FDA labeling OR strong endorsement/ support by nationally recognized compendia, as stated under “When Trastuzumab is covered.” Added the following statements under “Policy Guidelines” section: 1)Drugs prescribed for treatment of cancer in accordance with FDA label may be considered medically necessary when clinical benefit has been established, and should not be determined to be investigational as defined in Corporate Medical Policy, Investigational (Experimental) Services.” 2) Please refer to CMP “Investigational (Experimental) Services” for a summary of evidence standards from nationally recognized compendia. Medical director review 3/2017. Specialty Matched Consultant Advisory Panel review 3/29/17. No change to policy statement. (lpr)
Medical policy is not an authorization, certification, explanation of benefits or a contract. Benefits and eligibility are determined before medical guidelines and payment guidelines are applied. Benefits are determined by the group contract and subscriber certificate that is in effect at the time services are rendered.
