DNA Based Testing for Adolescent Idiopathic Scoliosis

Adolescent idiopathic scoliosis (AIS) is the most common pediatric spinal deformity affecting 1 to 3% of adolescents. This disease, of unknown etiology, occurs in otherwise healthy children with the onset highly correlated with the adolescent growth spurt. The vertebrae become misaligned such that the spine deviates from the midline laterally and becomes rotated axially. Deviation can occur anteriorly (a lordotic deviation), posteriorly (a kyphotic deviation) or laterally. Although AIS affects females and males in a nearly 1:1 ratio, progression to severe deformity occurs more often in females. Because the disease can have rapid onset and produce considerable morbidity, school screenings have been recommended. However, screening remains somewhat controversial, with conflicting guidelines supporting this practice or alternatively suggesting insufficient evidence for this.

The familial nature of this disease was noted as early as 1968. About one-quarter of patients report a positive family history of disease and twin studies have consistently supported shared genetic factors. Genome-wide linkage studies have reported multiple chromosomal regions of interest, often not replicated. DNA testing to predict the risk of progression of AIS is a novel development in the field of genetics.

Regulatory Status

The ScoliScore™AIS prognostic DNA-based test (originally developed by Axial Biotech, Salt Lake City, UT; test rights acquired by Transgenomic in 2013) has not been approved or cleared by the U.S Food and Drug Administration (FDA), but is being offered as a laboratory-developed test. The laboratory performing this test is accredited by the Centers for Medicare and Medicaid (CMS) under the Clinical Laboratory Improvement Amendments of 1988 (CLIA).

***Note: This Medical Policy is complex and technical. For questions concerning the technical language and/or specific clinical indications for its use, please consult your physician.

Policy

DNA based testing for adolescent idiopathic scoliosis is considered investigational. BCBSNC does not provide coverage for investigational services or procedures.

Benefits Application

This medical policy relates only to the services or supplies described herein. Please refer to the Member's Benefit Booklet for availability of benefits. Member's benefits may vary according to benefit design; therefore member benefit language should be reviewed before applying the terms of this medical policy.

When DNA Based Testing for Adolescent Idiopathic Scoliosis is not covered

DNA based testing for adolescent idiopathic scoliosis is considered investigational. BCBSNC does not cover investigational services or procedures.

Policy Guidelines

Adolescent idiopathic scoliosis is a disease of unknown etiology that causes mild to severe spinal deformity in approximately 1% to 3% of adolescents. While there is controversy about the value of both screening and treatment, patients once diagnosed are frequently closely followed. In cases with significant progression of curvature, both medical (bracing) and surgical (spinal fusion) interventions are considered. Classification tables for likelihood of progressive disease have been constructed to assist in managing patients, but these have not proven to be highly reliable and the impact of their use on outcomes is unknown.

There is no direct evidence demonstrating that use of this test results in changes in management that improve outcomes. The value of early identification and intervention(s) for individuals at risk for progression of disease is unclear. The evidence is insufficient to permit conclusions about the clinical utility of DNA-based predictive testing for scoliosis.

In 2004, the U.S. Preventive Services Task Force (USPSTF) recommended against the routine screening of asymptomatic adolescents for idiopathic scoliosis (Grade D Recommendation). No USPSTF recommendations for DNA-based testing for adolescent idiopathic scoliosis were identified.

Billing/Coding/Physician Documentation Information

This policy may apply to the following codes. Inclusion of a code in this section does not guarantee that it will be reimbursed. For further information on reimbursement guidelines, please see Administrative Policies on the Blue Cross Blue Shield of North Carolina web site at www.bcbsnc.com. They are listed in the Category Search on the Medical Policy search page.

Applicable service codes: 0004M, G0452, 81479

BCBSNC may request medical records for determination of medical necessity. When medical records are requested, letters of support and/or explanation are often useful, but are not sufficient documentation unless all specific information needed to make a medical necessity determination is included.

Policy Implementation/Update Information

10/11/11 New policy developed. DNA based testing for adolescent idiopathic scoliosis is not covered. It is considered investigational. BCBSNC does not cover investigational services or procedures. Medical Director review 8/2011. (mco)

3/20/12 Specialty Matched Consultant Advisory Panel review 2/2012. No changes to policy statement. (mco)

10/30/12 References updated. No changes to Policy Statement. (mco)

1/1/13 Deleted the following statement from the Billing/Coding section: “There is no specific CPT code for this test. A series of molecular diagnostic codes such as 83891, 83898, 83903, 83012 would likely be used.” Added code 81599, G0452 to Billing/Coding section. (mco)

7/1/13 Deleted unlisted CPT code 81599 and added CPT code 0004M to Billing/Coding section. (mco)

8/27/13 References update. No changes to Policy Statement. (mco)
